Math 3
VII-3 Linear Equations: Clear Decimals/Fractions

Name:_____
Date: _____ Per: ___

**In words, describe the multiplication property of equality. How can this property be used to make equations with decimals and fractions "easier"?**

1) $0.4x - 12 = 0.8$

2) $0.05x + 0.3 = 2$

3) $2x - \frac{1}{3} = 24 - \frac{8}{3}x$

4) $3x + 2 = \frac{5}{2}x - \frac{3}{8}$

5) $\frac{1}{5}(3x + 20) = \frac{1}{4}(8 + 2x)$

6) $\frac{1}{3}(5x + 1) = \frac{1}{6}(2x - 7)$

**Practice/You Try:**

1) $2.7x - 4 = 1.5x + 2$

2) $3.7x + 7 = 8.1x - 19.4$

3) $6.2x + 5 - 1.4x = 4.8x + 5$

4) $0.7x + 1.9 + 0.1x = 5.5 - 4.4x$

5) $x + 3 = -x - 10 - \frac{7}{3}x$

6) $x - 10 = \frac{5}{6}x - 7 - \frac{1}{3}x$

7) $\frac{5}{8}x - \frac{3}{8} = \frac{1}{2}x + \frac{7}{8}$

8) $\frac{1}{8}(5x + 64) = \frac{1}{4}(20 + 2x)$

9) Boberto solves problems with fractions and decimals by clearing them out. Bobah doesn't understand why Boberto would take the extra step to do that. Write a letter to Bobah from Boberto explaining why he does this.
