Practice/You Try:

1) $10(2.7x - 4) = (1.5x + 2)10$

$27x - 40 = 15x + 20$

$-15x \quad +40 \quad -15x + 40$

$\frac{12x}{12} = \frac{60}{12}$ $x = 5$

2) $10(3.7x + 7) = (8.1x - 19.4)10$

$37x + 70 = 81x - 194$

$-81x \quad -70 \quad -81x - 70$

$\frac{-44x}{-44} = \frac{-264}{-44}$ $x = 6$

3) $10(6.2x + 5 - 1.4x) = (4.8x + 5)10$

$62x + 50 - 14x = 48x + 50$

$48x + 50 = 48x + 50$

$-48x \quad -48x$

$50 = 50$

IS

4) $10(0.7x + 1.9 + 0.1x) = (5.5 - 4.4x)10$

$7x + 19 + x = 55 - 44x$

$8x + 19 = 55 - 44x$

$+44x \quad -19 \quad -19 \quad +44x$

$\frac{52x}{52} = \frac{36}{52} \rightarrow x = \frac{9}{13}$

5) $3(x + 3) = (-x - 10 - \frac{7}{3}x)3$

$3x + 9 = -3x - 30 - 7x$

$3x + 9 = -10x - 30$

$+10x - 9 \quad +10x - 9$

$\frac{13x}{13} = \frac{-39}{13}$

$x = -3$

6) $6(x - 10) = (\frac{5}{6}x - 7 - \frac{1}{3}x)6$

$6x - 60 = 5x - 42 - 2x$

$6x - 60 = 3x - 42$

$-3x + 60 \quad -3x + 60$

$\frac{3x}{3} = \frac{18}{3}$ $x = 6$

7) $8(\frac{5}{8}x - \frac{3}{8}) = (\frac{1}{2}x + \frac{7}{8})8$

$5x - 3 = 4x + 7$

$-4x + 3 \quad -4x + 3$

$x = 10$

8) $8[\frac{1}{8}(5x + 64)] = [\frac{1}{4}(20 + 2x)]8$

$(5x + 64) = 2(20 + 2x)$

$5x + 64 = 40 + 4x$

$-4x \quad -64 \quad -64 \quad -4x$

$x = -24$

9) Boberto solves problems with fractions and decimals by clearing them out. Bobah doesn't understand why Boberto would take the extra step to do that. Write a letter to Bobah from Boberto explaining why he does this.

BOBAH -

I HATE DEALING WITH FRACTIONS / DECIMALS UNLESS I HAVE TO. CLEARING MAKES IT AN EASIER PROBLEM TO ME.
