Practice Test

Aanya wrote the following four equations.

 Aanya's Work

- A. $6x - 8 = 4(x - 2) + 2x$
- B. $3(x - 1) + 2x = 3(x - 1) + 2$
- C. $7x + 2 - x = 6(x + 2)$
- D. $4(x + 3) + x = 5(x + 1) + 7$

She examined them, without solving them, to determine which has exactly one solution. Which of Aanya's equations has exactly one solution?

$$4(x + 3) + x = 5(x + 1) + 7$$

$$3(x - 1) + 2x = 3(x - 1) + 2$$

$$6x - 8 = 4(x - 2) + 2x$$

$$7x + 2 - x = 6(x + 2)$$

Kadesha is simplifying the given expression.

$$-(x - 3) - 2(x - 1)$$

She lists the steps that she uses to simplify the expression as follows:

Kadesha's Work

Step 1: Distribute -1 through $(x - 3)$, and distribute -2 through $(x - 1)$.

Step 2: Rewrite the expression as $-x - 3 - 2x - 2$.

Step 3: Combine $-x$ and $-2x$, and combine -3 and -2 .

Step 4: The simplified expression is $-3x - 5$.

In which step did Kadesha make the first error?

She made the first error in Step 4 because the simplified expression is $-x - 5$.

She made the first error in Step 1 because only -2 should be distributed through the parentheses.

She made the first error in Step 2 because Step 2 should be $-x + 3 - 2x + 2$.

She made the first error in Step 3 because $-x$ and $-2x$ cannot be combined.

Linear Equations

What is the first step in solving the equation $\frac{2}{3}x + \frac{1}{3}x + 2 = 5$?

Combine like terms. ✓

Multiply each side of the equation by 5.

Subtract $\frac{1}{3}$ from each side of the equation.

Add 2 to each side of the equation.

Linear Equations

The diagram shows algebra tiles representing the equation $x^2 + 2x + 1 = (x+1)^2$. On the left, there are two large blue tiles labeled x , two smaller purple tiles labeled 1 , and one small purple tile labeled 1 . These are arranged to form a square. On the right, there are three orange tiles labeled $-x$, $-x$, and $-x$.

What do the three red tiles in the model of the given equation represent?

Linear Equations

The graphic models one of the properties used to solve a one variable equation.

$$8(3x + 40) = 10$$

Which property is being modeled?

commutative property of multiplication

addition property of equality

associative property of addition

distributive property of multiplication ✓

Linear Equations

The diagram shows algebra tiles representing the equation $3x + 4 = -2x$. On the left side, there are three blue vertical rectangles labeled x , and four small purple squares labeled 1 . On the right side, there are two yellow vertical rectangles labeled $-x$. An equals sign is placed between the two sides.

What do the four yellow tiles in the model of the given equation represent?

$-4x$
